3. Shriram Venkat Peddhibhotla
4. Devesh Joshi

# Abstract

## Business Problem

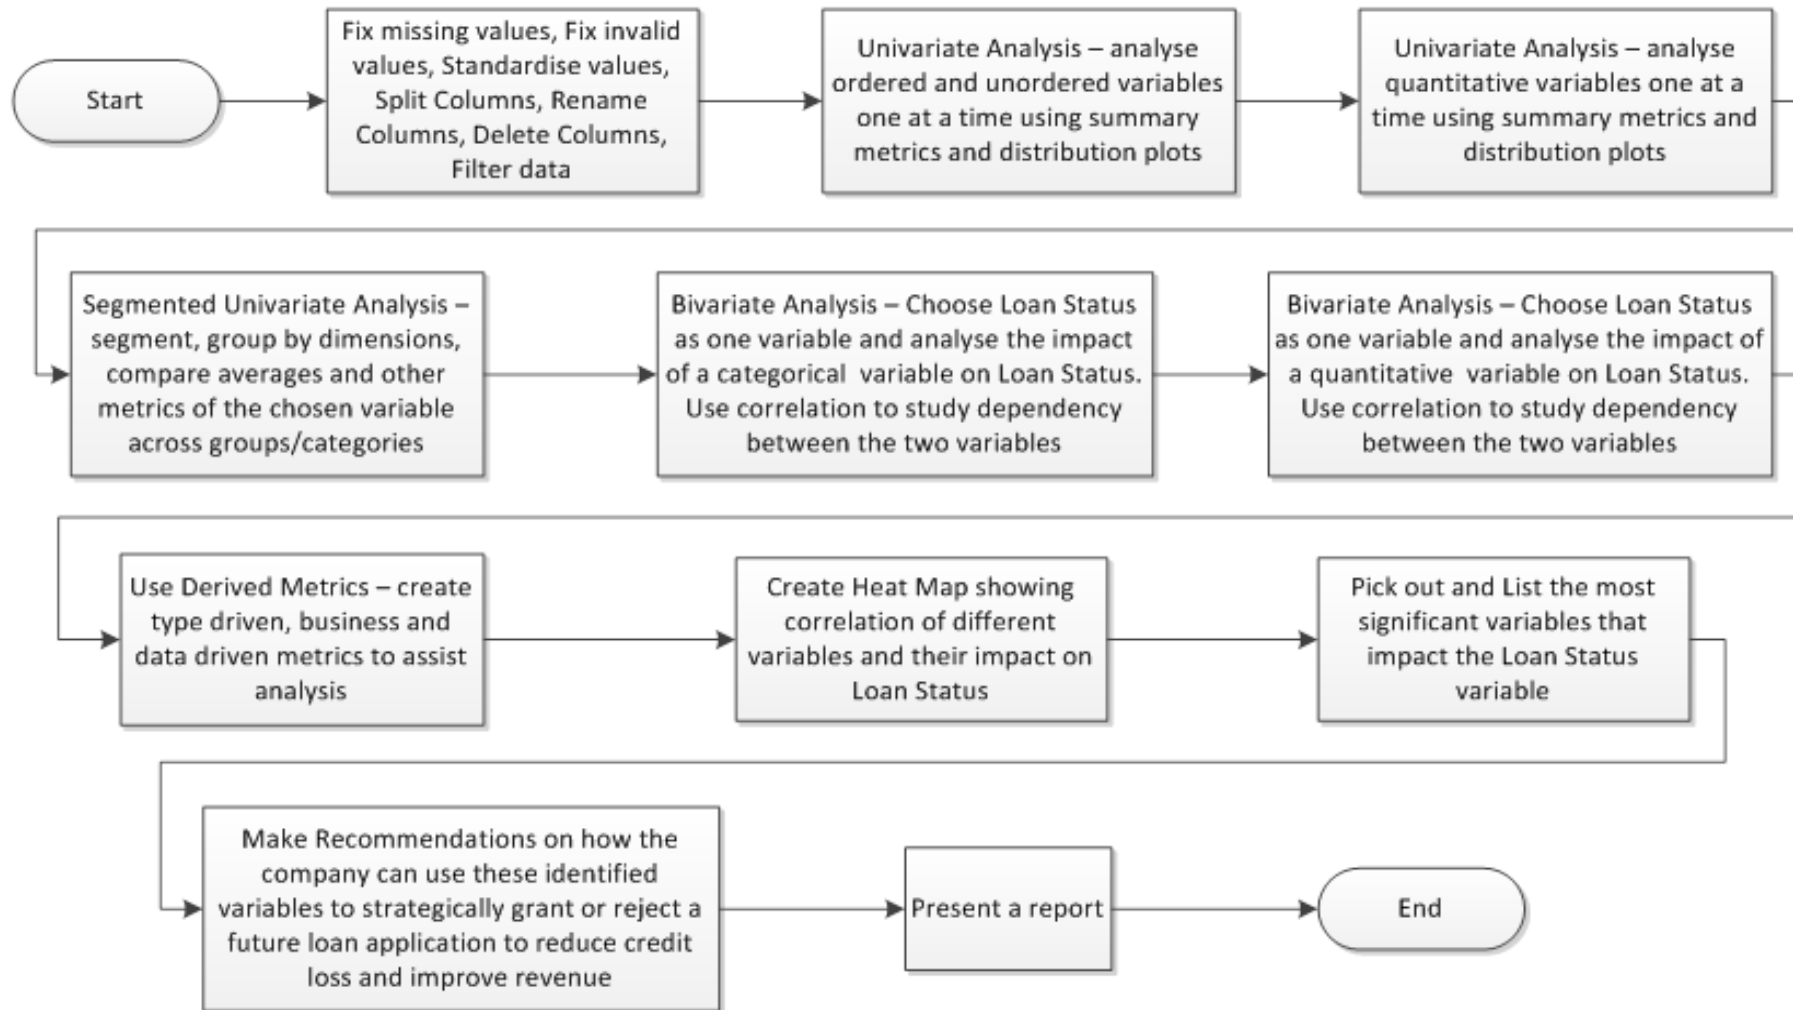

- Company faces a risk of losing money by lending to risky loan applicants
- Company may lose business if loan is not granted to an individual who is able to repay the loan
- How to minimise risk of losing money while lending money to customers

## Objectives

Carry out research in risk analytics and conduct analysis using data from previous loan applicants to,

- Understand the consumer and loan attributes that influence the tendency to default
- Identify driving factors behind loan default
- Identify borrowers who are capable of defaulting on their loans
- Identify risky loan applicants
- Reduce credit loss to company by not lending loans to risky applicants

# Problem Solving Methodology

# Univariate Analysis – Loan Status

- 83% of the total loans were Fully Paid by customers.
- **14.2% of total customers defaulted on their loans.**

# Univariate Analysis – Loan Term

- 73% of people chose a loan term of 3 years i.e 36 months
- 27% of people chose a long term loan of 5 years ie 60 months

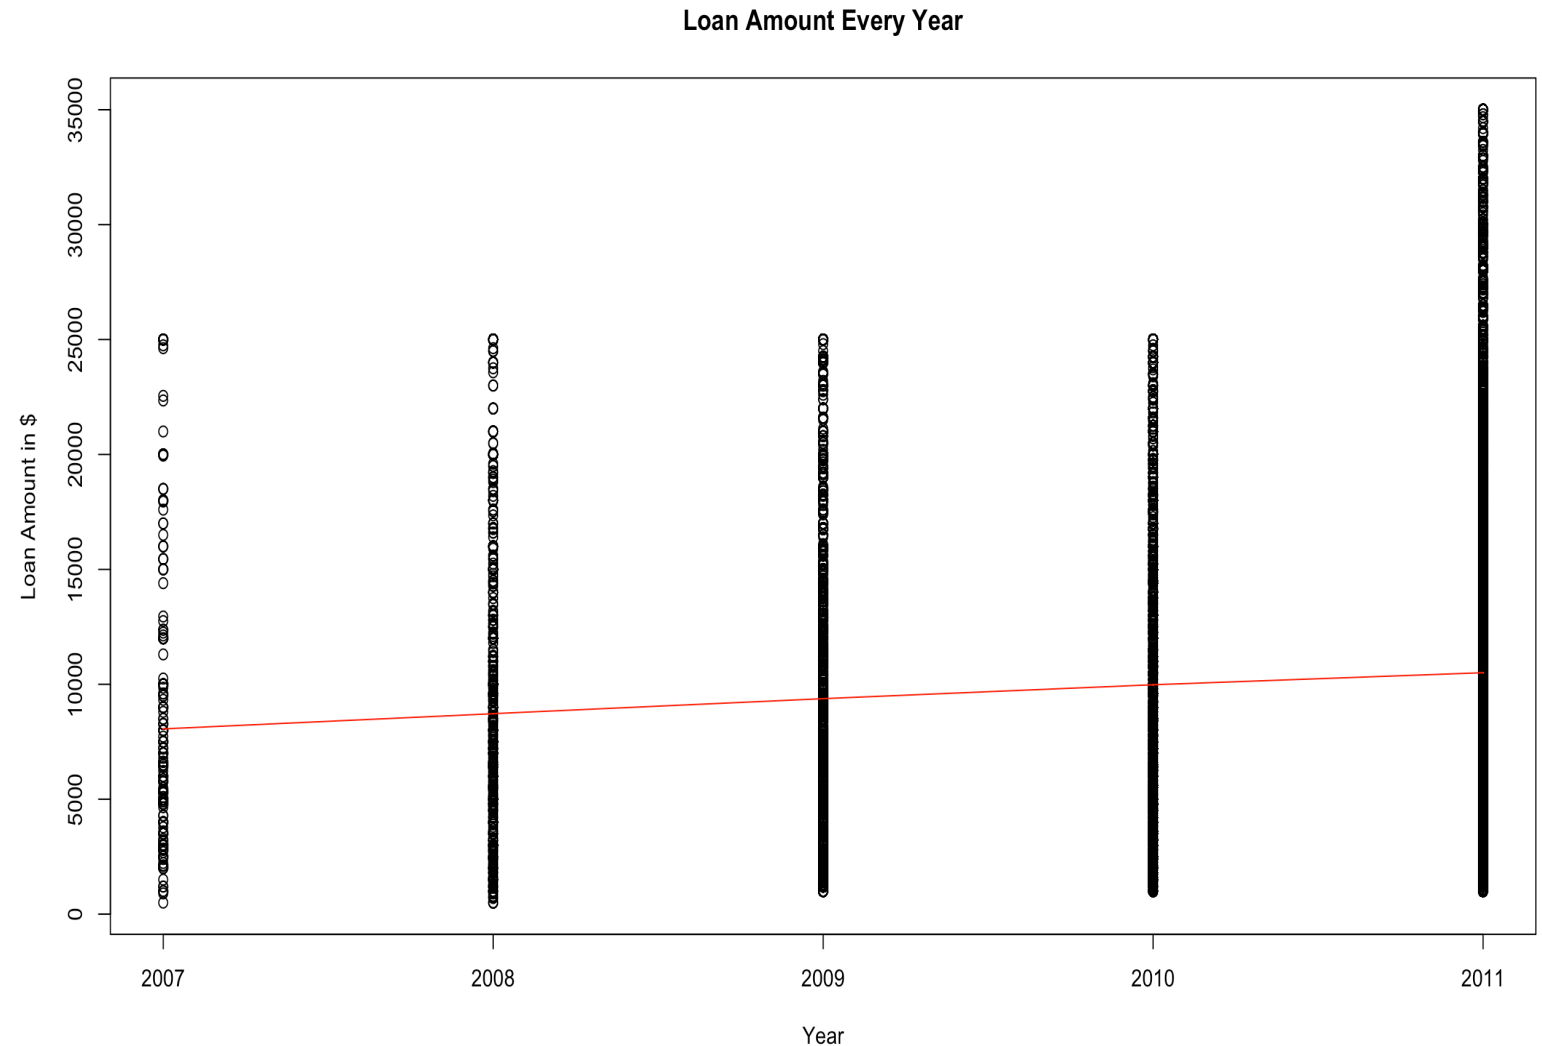

# Univariate Analysis – Loan Purpose

- 47% of people applied for a loan for the purpose of Debt Consolidation
- 13% of people applied for a loan for the purpose of Credit Card
- Other popular reasons include Home Improvement, Major Purchase, Small Business, Car, Wedding, Medical and Moving

# Univariate Analysis – Loan Amount

- Average loan amount is \$10000
- Average Loan amount has been increasing each year and shows a steady positive trend

# Univariate Analysis – Loan Interest Rate

- Average interest rate for a loan is 12%
- There are 9832 customers out of a total 39717 who have loans with interest rate in excess of 14.6
- Nearly 25% of loans have a high interest rate

# Univariate Analysis – Verification Status

- 43% of loans did not have either the customer's income or its source verified
- 25% of loans had both the customer's income and its source verified
- 32% of loans had the customer's income verified but not its source

# Univariate Analysis – Debt To Income

- Average DTI of loan applicants was 13
- Debt in the population is growing as there is a steady increase in DTI every year

# Bivariate Analysis – Purpose vis-à-vis Status

- 57% of people borrowed loan for debt consolidation and 8% of those defaulted on their loans
- Highest defaulters were when the purpose for loan was Debt Consolidation
- A total of 10% people defaulted when purpose for loan was either debt consolidation or credit cards

# Bivariate Analysis – Term vis-à-vis Status

- 73% of applicants applied for a 3 year loan compared to 27% people who required a 5 year loan
- 8.1% of people defaulted when loan term was 36 months and 6% of people defaulted when it was 60 months
- If loan term in months increases there is a tendency for customers to default on their loans
- Customers on a longer duration loan term tend to be more risky

# Bivariate Analysis – Amount vis-à-vis Status

- More than 50% of the loan amounts were between \$5000 and \$15000 i.e Medium group
- Nearly 7% of the customers in the medium loan group defaulted
- There is a positive relationship between the two variables
- As the loan amount increases there is a tendency for customers to default

# Bivariate Analysis – Interest Rate vis-à-vis Status

- Nearly 48% of customers have a medium loan rate i.e between 10% and 15% interest rate
- Only 2% of customers with low interest rate i.e below 10% defaulted on their loans
- Default rate is highest (6.9%) when loan rate is medium
- Around 20% of customers were on a high loan rate i.e above 15%.
- Nearly 5% of the high loan rate payers defaulted
- When Loan amount increases after \$5000 the interest rate increases steadily

# Bivariate Analysis – DTI vis-à-vis Status

- Nearly 48% of loans had Medium ( $\geq 10$  and  $< 20$ ) DTI percentage. Around 7% of these defaulted on their loans
- Only 3% of people with a High ( $\geq 20$ ) DTI percentage defaulted on their loans
- When the DTI of a customer increases then the loan rate tends to marginally increase

# Bivariate Analysis – Annual Inc vis-à-vis Status

- 84% of the borrowers were in very low and low income groups
- Default rate was 6% in both very and low income groups
- Risk of default is high in very low and low income groups and low in High income group
- When annual income increases the debt to income tends to decrease

# Bivariate Analysis – Grade vis-à-vis Status

- Maximum number of loans were in grade B, which accounts to 31% of all loans
- Most number of defaults were in Grades B and C
- When loan grade decreases interest rate increases steeply
- Default risk increases as loan grade decreases

# Bivariate Analysis – Home vis-à-vis Status

- 47.6% of loan applicants lived in rental homes and 7.1% of these customers defaulted
- 44.5% of customers were currently paying mortgage and out of which 5.9% defaulted on their loans
- Only 1.1% of customers who owned their property defaulted on their loans
- Customers living on rent or paying mortgages have more tendency to default than people who own a property
- If customers are owners of a property then the chance of defaulting decreases

# Bivariate Analysis – Verification vis-à-vis Status

- 5.4% Defaulted when customer's income was not verified
- Low default rate of 3.6% when the customer's source of income was verified

# Bivariate Analysis – State vis-à-vis Status

- Top 5 states for loan applications were CA, NY, FL, TX and NJ
- CA had the most defaulters of 6.1% followed by NY of 2.7% and FL of 2.7%

# Bivariate Analysis – Emp Length vis-à-vis Status

- Employee length was below 5 years for 50% of loans
- 22% of loans were taken by customers who had over 10 years of experience
- There is a higher tendency to default on the loans when employees length of work is less than 5 years

# Multi-Variate Analysis – Heat Map

# Key Observations From Heat Map

- Risk of default increases when Interest Rate on the loan increases
- Tendency to default on a loan increases when the loan Term increases
- When loan Grade decreases then the potential to default on the loan increases
- Higher loan amounts are riskier and increase the chances of default
- Customers with a higher Debt To Income percentage are more riskier
- Customers with derogatory Public Records are more riskier
- Customers with a low or very low Annual Income have a higher tendency to default
- Customers who own their Home have a lesser tendency to default compared to living on Rent or paying Mortgage
- Customers with a low employment length have a higher tendency to default

# Significant Customer Attributes

Analysis of Consumer attributes from the data has highlighted the following attributes that are key drivers for default.

**Key Customer attributes for Loan Default are:**

	Relationship with Loan Default	Effect of variable on Loan Status
<b>Debt To Income</b>	+0.05	Higher the DTI more riskier the customer becomes
<b>Public Record</b>	+0.05	A customer with derogatory public record has a higher chance of defaulting
<b>Annual Income</b>	-0.04	Customer with a high annual income tends to be less riskier
<b>Employee Length</b>	+0.02	Customer with a low employee length tends to be more riskier
<b>Home Ownership</b>	-0.02	Home owners are less riskier then living on rent or paying mortgage

# Significant Loan Attributes

Analysis of Loan attributes from the data has highlighted the following attributes that are significant drivers for default.

**Key Loan attributes for Loan Default are:**

	Relationship with Loan Default	Effect of variable on Loan Status
Interest Rate	+0.23	Higher interest rates increases the chances of default
Term	+0.21	Longer the term higher the chances are of default
Grade	-0.21	Lower grade loans have a higher chance of default
Loan Amount	+0.08	Higher the loan amount higher the chances of default
Installment	+0.04	Higher the installment amount higher the chances of default

# Conclusions

Analysis of consumer and loan attributes that influence the tendency to default was carried out. Top 5 variables which are strong indicators of default were identified.

Following conclusions have been reached,

- Key **Loan** attributes are **Interest Rate, Term and Grade**
- Key **Customer** attributes are **Public Record, DTI and Annual Income**

**Key driver attributes for Loan Default are:**

1. Interest Rate
2. Term
3. Grade
4. Public Record
5. Annual Income

# Recommendations

Company will benefit from considering the following strategy when approving a loan application. The proposed strategy is based on the most important customer and loan attributes that have a significant influence on loan default.

## Recommended Strategy

A loan has a **higher rate of default** when the following conditions are met.

- Interest rate is greater than 10 and
- Term is greater than 36 months and
- Grade is lower than B and
- When customer has a derogatory Public Record and
- Annual Income of the customer is lesser than \$10000 and
- DTI is greater than 10
